UNIVERSITY

CROSS-HEALTH PLATFORM

CROSS-HEALTH

Research is often conducted in silo's: research destined to benefit plant, animal or human. However, these species share more similarities than differences. An interdisciplinary exchange of knowledge and insights speeds up discoveries and applications for multiple species and for a variety of health aspects.

OUR AIM

To connect researchers with complementary expertise across species and technologies.

To investigate whether existing technology for one species could be of use to other species.

To perform research with health applications that benefit more than one species.

OUR TEAM

Our platform is financed by the AUGent Industrial Research Fund and supports interspecies business development activities across (veterinary) medicine, medicinal chemistry, cell and tissue engineering, (plant) biotechnology, micro and macro-electronics and photonics, medtech, big data and AI. Daily operation is conducted by Laetitia Cicchelerio.
